

CHALLENGE

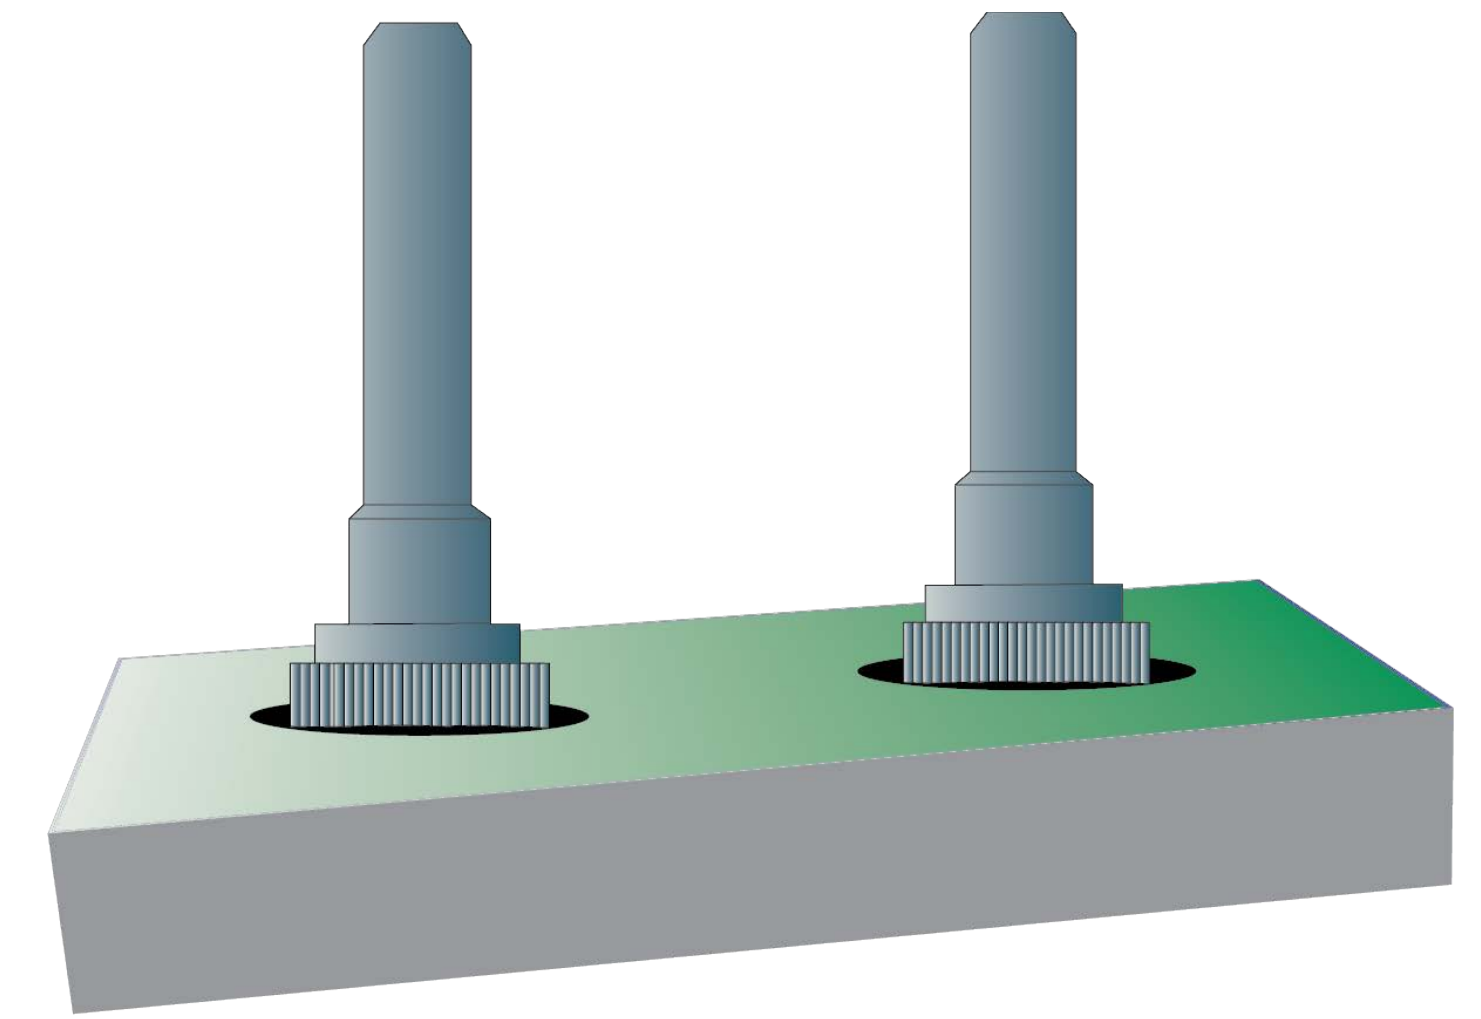

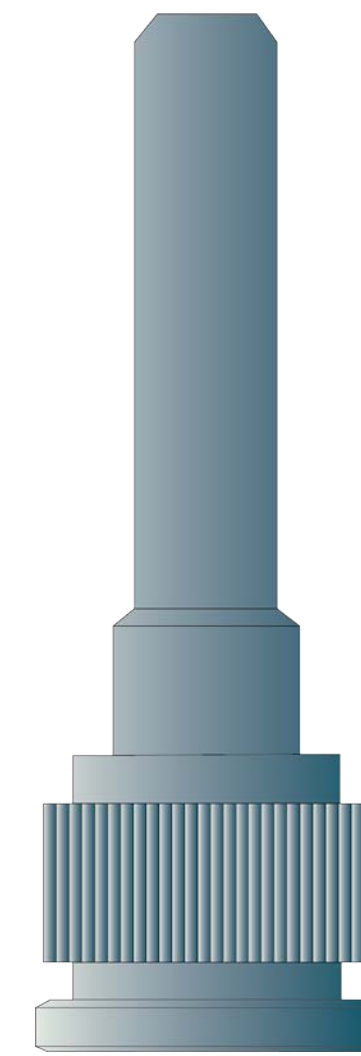

Customer engaged EFC to help develop a new stud in order to overmold into a bracket. During the development of the bracket and stud, the customer determined they did not have capacity at their plant to produce the complete part.

SOLUTION

EFC worked with our injection molding partner in Canada who could produce the molding with the EFC supplied metal studs.

RESULT

As a result, EFC is supplying one single part number to the customer. The customer did not have to set up multiple part numbers in their system for child and parent parts. In addition, they reduced complexity inside their manufacturing plant and were able to transition this to a purchased item.
Net savings \$11k annually.
